

A Test-drive of a Ulysses

A writing program

[Ulysses](#) is a writing program that I putzed with for about 5 minutes during NaNoWriMo but didn't look at again. Then it turned out they were offering a few free copies of the software to lucky contestants in a draw. I entered. I won. So now I have my own fully functional copy of Ulysses to play with.

It features iCloud syncing, sheets that can be merged etc, export styles, and attachments. Ulysses is designed to make writing easier. I have generally used [IA Writer Classic](#) in the past because I have old version that work on my old first gen iPad. I am not sure yet if I will switch but that's what this exercise is for.

Markdown

Ulysses uses Markdown XL for formatting functions. I have previously dabbled in [Markdown on the blog](#) but this has a few more bells and whistles. The full list of available definitions is accessible via `⌘9` or the toolbar's **A|** button.

I am writing these all down again as a reminder to myself and to practice getting used to the language.

Heads (preceded by pound symbols – one for each level)

quote: preceded by greater than (>) symbol

emphasis is **I** or a bracketed by single asterisks (*)

Bold is **B** or a bracketed by double asterisks (**)

A divider is 4 dashes

Lists

- unordered lists
- are preceded
- by a dash
- and a space

1. ordered lists
2. are preceded by
3. the numeral,
4. a period
5. and the space

Add **highlighted text** (bracketed by double colons ::) or deletions (bracketed by double vertical bars | |)

Comments are bracketed by double plus symbols ++**you can see this comment only because I overrode the code**++

...or are paragraphs preceded by double percent signs

AM AM

% This is a comment paragraph, again visible because I used code to override

Text Objects

A Footnote¹ Type (fn), enter your footnote text and hit Cmd-return

To [add a link](#), type square brackets [] around a word or phrase (or use the ⌘K shortcut).

To add an annotation type curly brackets { } around a phrase, It is basically a note added to that phrase. I don't think it exports.

`` is done by bracketing with the tick mark (found under the tilde). Entire paragraphs can be done by preceding with double single quote marks

`code code code code etc`

Executable code that won't show in a pdf but will in a html doc can be made by using Raw Source: bracketing with double tildes or paragraphs preceded by double tildes.

So this `~~A link to never-forever.ca done manually in html~~` appears as this:

And finally, here's a link to a pdf which seems to upload the file but not link properly to it when exported direct to Wordpress.

And that's it for the Markdown portion of Ulysses. More to come...

¹ This is a footnote (it appears at the bottom with an automatic link)
